

CHATEAU CHEVAL BLANC

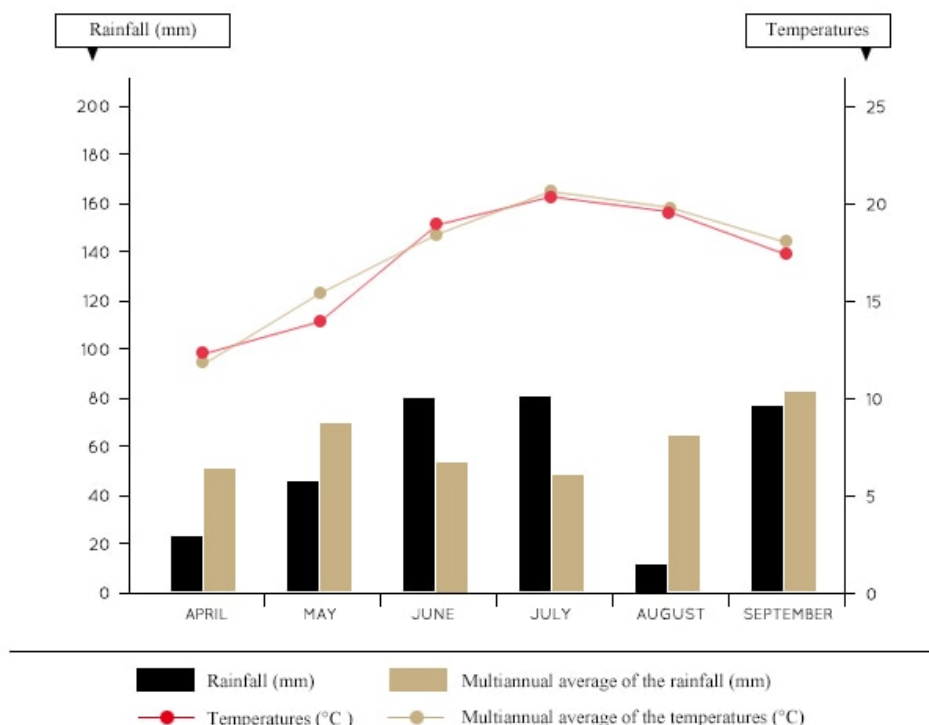

1957

The weather in 1957 was satisfactory. However, the vines had not fully recovered from the frost of 1956 and were propagated with layering. Wine quality was honourable, especially considering the challenging effect of the previous year's frost.

TEMPERATURES AND RAINFALL

April was dry and mild, while May was somewhat cooler. Summer temperatures were close to seasonal averages. June and July were rainy. The beginning of ripening took place during dry weather that lasted until September, with just about average rainfall.

WATER BALANCE

As the water balance shows, the drought conditions in August brought about a slight water stress - a major

factor in producing quality grapes.

1957 WATER BALANCE

GROWING SEASON

The harvest started on the 3rd of October. Yields were a miserable 8 hectolitres per hectare due to the effect of the 1956 frost.

Degree of alcohol: 12°.

	Begin	End
